

Module

timeit

Introduction

The timeit Module

◆ **Module:**

The timeit Module

◆ Purpose:

The timeit Module

```
import timeit
```

Import statement

```
timeit.timeit("[i for i in range(10000)]", number=500)
```

timeit function

Code that you want to test

Number of repetitions

The timeit Module

```
>>> import timeit
>>> timeit.timeit("[i for i in range(10000)]", number=500)
0.30713721199999355
```

↑
Measured time for *number* executions

The timeit Module

```
timeit.timeit(stmt='pass', setup='pass', timer=<default timer>, number=1000000, globals=None) ¶
```

◆ Parameters:

- ◆ **stmt** (statement): code that will run (string).
- ◆ **setup**: code that will be executed once before starting to measure statement.
- ◆ **timer**: the timer function (use default).
- ◆ **number**: number of repetitions.
- ◆ **globals**: creates a namespace. You can pass current globals to use the functions that were defined in the file.

The timeit Module

The timeit Module

- ◆ Linear Search vs. Binary Search
- ◆ Bubble Sort – small and large lists
- ◆ Selection vs. Insertion Sort
- ◆ Insertion Sort vs. Merge Sort vs. Quicksort
- ◆ Analyze the Results
- ◆ Mini Project
